Power analysis can either be done before (a priori or prospective power analysis) or after (post hoc or retrospective power analysis) data are collected. A priori power analysis is conducted prior to the research study, and is typically used in estimating sufficient sample sizes to achieve adequate power. Post-hoc analysis of "observed power" is conducted after a study has been completed, and ...

The power system analyses discussed in the IEEE Brown Book can help answer many questions about an existing system, such as the impact of expansion, the stability of the system, and the load distribution of the system. Chapters are devoted to different types of studies, and also include guidance on the preparation for these studies.

Pricing continues to vary widely across individual projects, reflecting, among other things, differences in system sizing and design, installer-level pricing strategies, and local market conditions. For example, among residential systems installed in 2019, the lowest 20% were priced below \$3.1/W, while the highest 20% were above \$4.5/W.
